$X \subseteq \mathbb{C}^N$ a conic variety

$U \subseteq \mathbb{C}^N$ a linear subspace

Describe $U \cap X$?

$X \subseteq \mathbb{C}^N$ a conic variety

$U \subseteq \mathbb{C}^N$ a linear subspace

Describe $U \cap X$?

$X \subseteq \mathbb{C}^N$ a conic variety

$U \subseteq \mathbb{C}^N$ a linear subspace

Describe $U \cap X$?

U

X

1. Certify $U \cap X = \{0\}$

2. Compute $\text{dist}(U, X)$

3. Find elements of $U \cap X$ (and show that these are the only ones)

$$X_1 = \{v \otimes w : v, w \in \mathbb{C}^n\} \subseteq \mathbb{C}^n \otimes \mathbb{C}^n$$

Def: $U \subseteq \mathbb{C}^n \otimes \mathbb{C}^n$ is **1-entangled** if $U \cap X_1 = \{0\}$.

Applications:

- A PVM $0 \leq M \leq I_{n^2}$ on $\mathbb{C}^n \otimes \mathbb{C}^n$ is an **entanglement witness** \Leftrightarrow
 $\text{Im}(M) \subseteq \mathbb{C}^n \otimes \mathbb{C}^n$ is 1-entangled

$\text{Tr}(M\rho) < 1$ for every separable state ρ

- For a density operator $\rho \in D(\mathbb{C}^n \otimes \mathbb{C}^n)$,

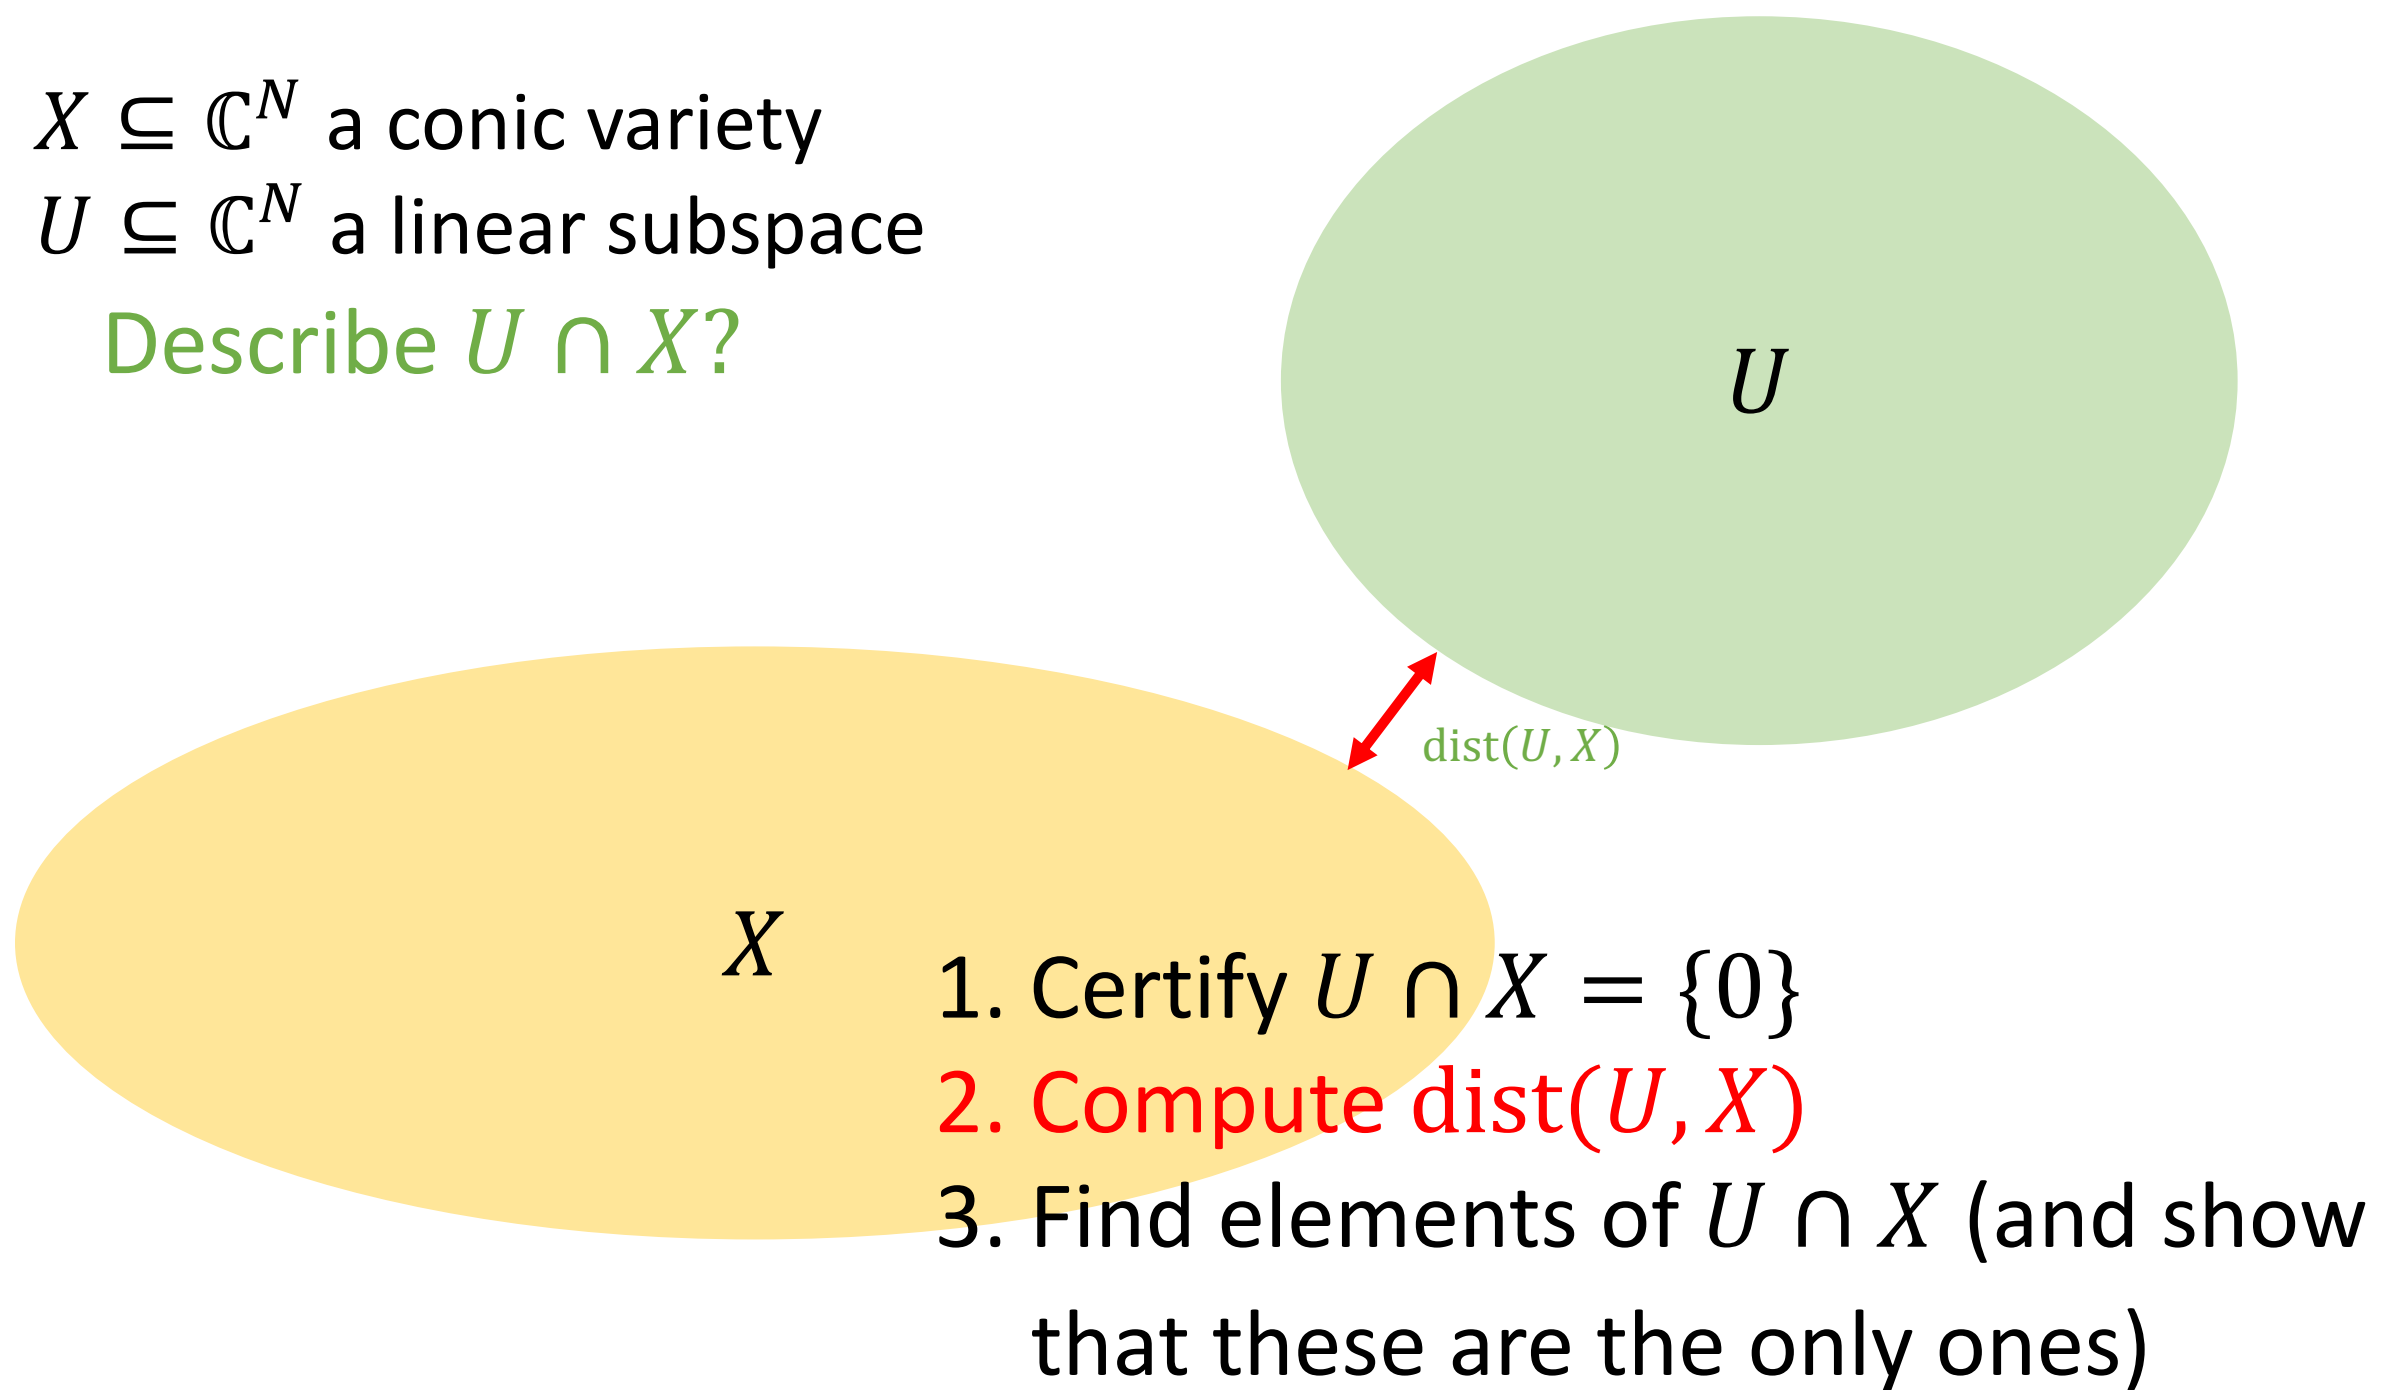

$\text{Im}(\rho)$ 1-entangled $\Rightarrow \rho$ is entangled

range criterion

- Quantum error correction

$X \subseteq \mathbb{C}^N$ a conic variety
 $U \subseteq \mathbb{C}^N$ a linear subspace

Describe $U \cap X$?

X

1. Certify $U \cap X = \{0\}$
2. Compute $\text{dist}(U, X)$
3. Find elements of $U \cap X$ (and show that these are the only ones)

Application: Computing the Geometric measure of entanglement/Injective tensor norm

$$T \in \mathbb{C}^n \otimes \mathbb{C}^n \otimes \mathbb{C}^n$$

$\text{dist}(T, X_1)$

$$X_1 = \{u \otimes v \otimes w : u, v, w \in \mathbb{C}^n\}$$

[Harrow and Montanaro, 2013]: 21 equivalent or closely related problems in quantum info and computer science, including:
Determining acceptance probability of QMA(2) protocols
Determining ground-state energy of mean-field Hamiltonians

$X \subseteq \mathbb{C}^N$ a conic variety

$U \subseteq \mathbb{C}^N$ a linear subspace

Describe $U \cap X$?

X

1. Certify $U \cap X = \{0\}$
2. Compute $\text{dist}(U, X)$
3. Find elements of $U \cap X$ (and show that these are the only ones)

Connection between finding elements of $U \cap X_1$ and decomposing tensors

Let $T \in \mathbb{C}^n \otimes \mathbb{C}^n \otimes \mathbb{C}^m$ be a tensor.

If $T(\mathbb{C}^m)$ has a basis of the form $\{x_1 \otimes y_1, \dots, x_R \otimes y_R\} \subseteq \mathbb{C}^n \otimes \mathbb{C}^n$,

Then $T = \sum_{i=1}^R x_i \otimes y_i \otimes z_i$, where $z_i = T((x_i \otimes y_i)^*)$.

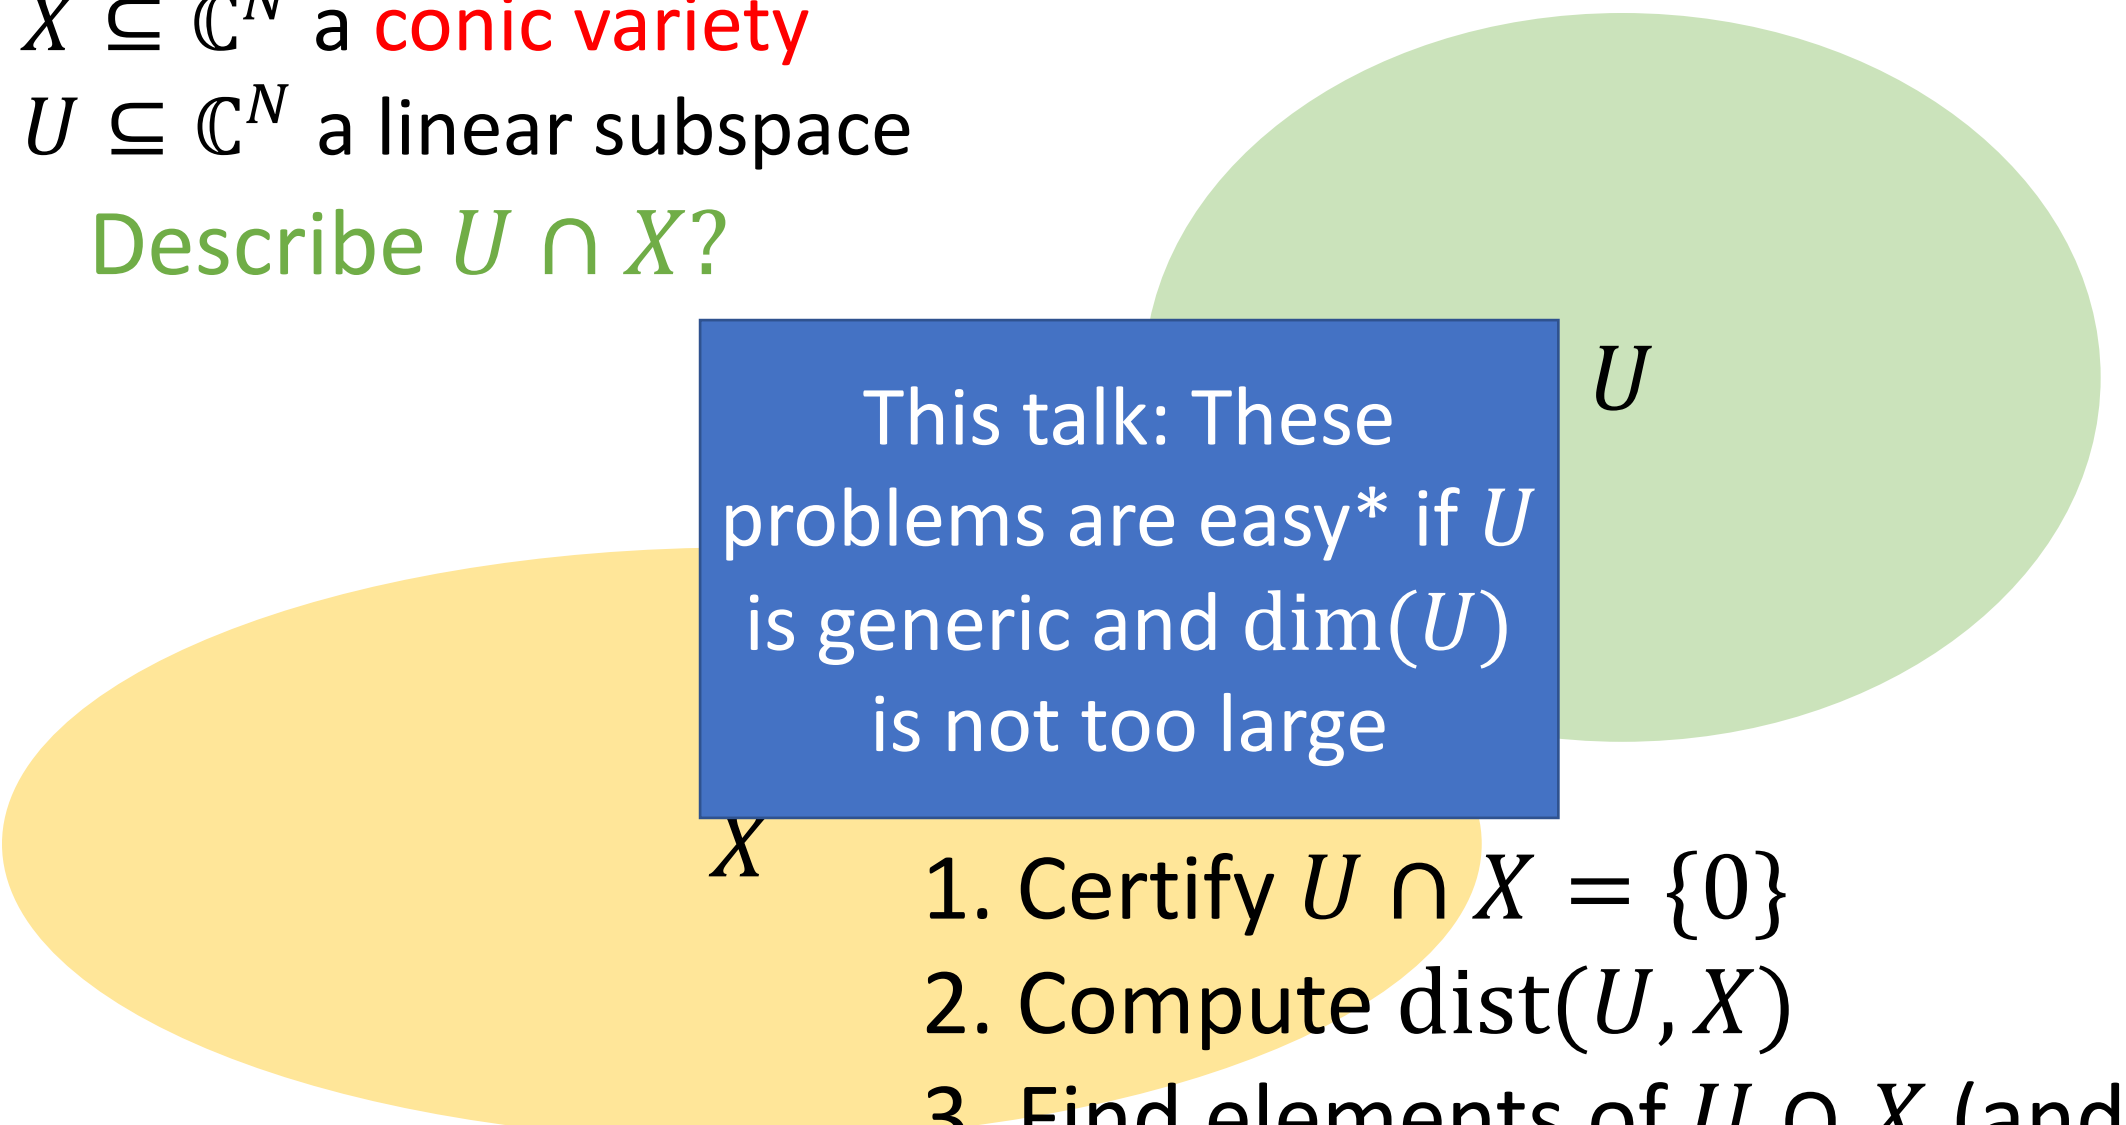

...So, algorithms for finding elements of $T(\mathbb{C}^m) \cap X_1$ lead to tensor decomposition algorithms

If $x_1 \otimes y_1, \dots, x_R \otimes y_R$ are the only elements of $T(\mathbb{C}^m) \cap X_1$ (up to scale), then $T = \sum_{i=1}^R x_i \otimes y_i \otimes z_i$ is the unique rank decomposition of T .

$X \subseteq \mathbb{C}^N$ a **conic variety**

$U \subseteq \mathbb{C}^N$ a linear subspace

Describe $U \cap X$?

This talk: These problems are easy* if U is generic and $\dim(U)$ is not too large

1. Certify $U \cap X = \{0\}$
2. Compute $\text{dist}(U, X)$
3. Find elements of $U \cap X$ (and show that these are the only ones)

Intersecting a subspace with a variety

- Let $V = \mathbb{C}^N$.
- $X \subseteq V$ is a **variety** if it is **cut out** by some $f_1, \dots, f_p \in \mathbb{C}[x_1, \dots, x_N]$, i.e.
$$X = \{v \in V : f_1(v) = \dots = f_p(v) = 0\}$$
- X is a **conic variety** if $\mathbb{C}X = X$.

Question: Given a (linear) subspace $U \subseteq V$, describe $U \cap X$.

$X \subseteq V$ is a **variety** if it is **cut out** by some $f_1, \dots, f_p \in \mathbb{C}[x_1, \dots, x_N]$, i.e.

$$X = \{v \in V : f_1(v) = \dots = f_p(v) = 0\}$$

Example: $X_1 = \{v \in \mathbb{C}^n \otimes \mathbb{C}^n : \text{rank}(v) \leq 1\} \subseteq \mathbb{C}^n \otimes \mathbb{C}^n$

$$\text{rank} \begin{bmatrix} a & b \\ b & c \end{bmatrix} \leq 1 \quad \Leftrightarrow \quad \det \begin{bmatrix} a & b \\ b & c \end{bmatrix} := ac - bd = 0$$

$n \times n$ matrix has rank ≤ 1 \Leftrightarrow determinant of every 2×2 submatrix is zero

So X_1 is cut out by $p = \binom{n}{2}^2$ homogeneous polynomials of degree $d = 2$

Other examples...

- Schmidt rank $\leq r$ vectors:

$$X_r = \{v \in \mathbb{C}^n \otimes \mathbb{C}^n : \text{rank}(v) \leq r\}$$

- Product tensors: $X_1 = \{v_1 \otimes \cdots \otimes v_k : v_1, \dots, v_k \in \mathbb{C}^n\}$

- Biseparable tensors:

$$X_B = \{T \in (\mathbb{C}^n)^{\otimes m} : \text{Some flattening of } T \text{ has rank } 1\}$$

- Slice rank 1 tensors

$$X_S = \{T \in (\mathbb{C}^n)^{\otimes m} : \text{Some 1 v.s. all flattening of } T \text{ has rank } 1\}$$

- Matrix product states

Outline

Given a conic variety $X \subseteq \mathbb{C}^N$ and a linear subspace $U \subseteq \mathbb{C}^N$, describe $U \cap X$.

Algorithms to describe $U \cap X$

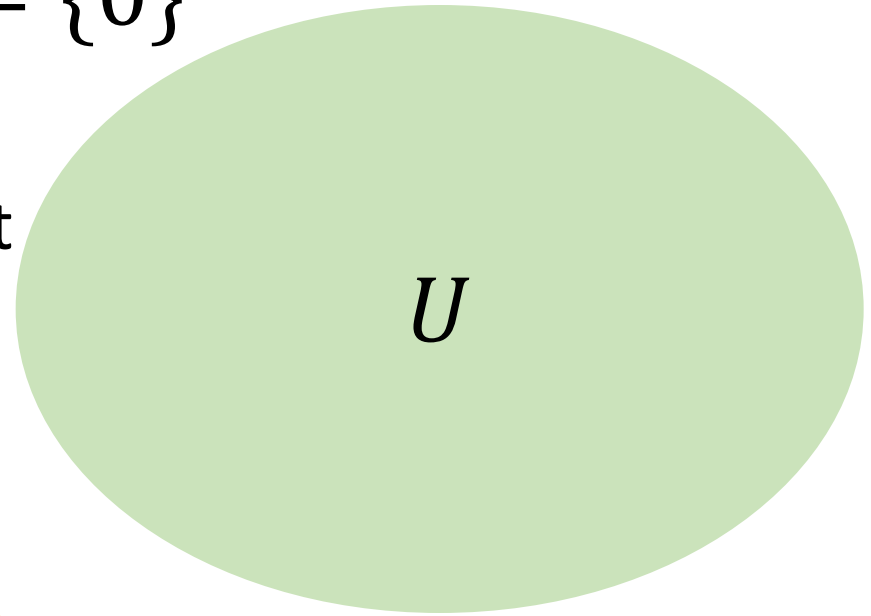

- ➔ Algorithm to certify $U \cap X = \{0\}$.
2. Algorithm to determine $\text{dist}(U, X)$.
3. Algorithm to recover elements of $U \cap X$.

Part 1: Algorithm to certify $U \cap X = \{0\}$

Input:

1. Polynomials $f_1, \dots, f_p \in \mathbb{C}[x_1, \dots, x_N]$ that cut out X .
2. A basis $\{u_1, \dots, u_R\}$ for U .

Output: Proof that $U \cap X = \{0\}$

Question: Given a (linear) subspace $U \subseteq V$, certify $U \cap X = \{0\}$.

Example: $X_1 = \{v \in \mathbb{C}^n \otimes \mathbb{C}^n : \text{rank}(v) \leq 1\}$

Schmidt rank

We say $U \subseteq \mathbb{C}^n \otimes \mathbb{C}^n$ is **1-entangled** if $U \cap X_1 = \{0\}$.

- [Buss et al 1999]: Determining whether U is 1-entangled is NP-Hard
- [Barak et al 2019]: Best known algorithm for determining 1-entanglement requires ϵ -promise and takes $2^{\tilde{O}(\sqrt{n}/\epsilon)}$ time.
- Theorem [JLV 2022]: Polynomial time algorithm if $\dim(U)$ is **small enough** and U is **generic**.

Theorem [JLV]: Case of $X_1 = \{v \in \mathbb{C}^n \otimes \mathbb{C}^n : \text{rank}(v) \leq 1\}$

For a **generic** linear subspace $U \subseteq \mathbb{C}^n \otimes \mathbb{C}^n$ of dimension

$$\dim(U) \leq \frac{1}{4}(n-1)^2$$

Constant multiple of
maximum possible $(n-1)^2$

it holds that $U \cap X_1 = \{0\}$, and our algorithm **certifies** this in time $n^{O(1)}$.

Analytic definition: If $\{u_1, \dots, u_R\} \in \mathbb{C}^n \otimes \mathbb{C}^n$ are chosen independently at random according to e.g. the uniform spherical measure, then with probability 1...

Algebraic definition: There is a Zariski open dense subset $A \subseteq (\mathbb{C}^n \otimes \mathbb{C}^n)^{\times R}$ such that...

Algorithm performance to certify $U \cap X_1 = \{0\}$

n	$\dim(U)$	time
3	3	0.01 s
4	8	0.03 s
5	13	0.08 s
6	20	0.20 s
7	29	0.49 s
8	39	1.06 s
9	50	2.24 s
10	63	5.56 s

More general statement for arbitrary X

Theorem [JLV]: Suppose that $X \subseteq \mathbb{C}^N$ is a **conic variety** cut out by $p = \delta \binom{N+d-1}{d}$ linearly independent homogeneous degree- d polynomials $f_1, \dots, f_p \in \mathbb{C}[x_1, \dots, x_N]_d$ for some $\delta \in [0, 1]$.

Then for a **generic** linear subspace $U \subseteq \mathbb{C}^N$ of dimension

$$\dim(U) \leq \frac{N + d - 1}{d!} \delta,$$

it holds that $U \cap X = \{0\}$, and there is an algorithm that certifies this in time $N^{O(d)}$.

Theorem [JLV]: If $X \subseteq \mathbb{C}^N$ is cut out by $p = \delta \binom{N+d-1}{d}$ linearly independent homogeneous degree- d polynomials, then for a **generic** linear subspace $U \subseteq \mathbb{C}^N$ of dimension

$$\dim(U) \leq \frac{N+d-1}{d!} \delta,$$

it holds that $U \cap X = \{0\}$, and there is an algorithm that certifies this in time $N^{O(d)}$ ← **Not bad: Takes $\binom{N+d-1}{d}$ time just to read off degree- d polynomials**

Example: If $d = 1$, then $X \subseteq \mathbb{C}^N$ is a linear subspace. Theorem says:
If $U \subseteq \mathbb{C}^N$ generic and $\dim(U) \leq \delta N = p = N - \dim(X)$,
Then $U \cap X = \{0\}$, and this can be verified in $\text{poly}(N)$ time.

Theorem [JLV]: If $X \subseteq \mathbb{C}^N$ is cut out by $p = \delta \binom{N+d-1}{d}$ linearly independent homogeneous degree- d polynomials, then for a **generic** linear subspace $U \subseteq \mathbb{C}^N$ of dimension

$$\dim(U) \leq \frac{N+d-1}{d!} \delta,$$

it holds that $U \cap X = \{0\}$, and there is an algorithm that certifies this in time $N^{O(d)}$.

Fact: For a conic variety $X \subseteq \mathbb{C}^N$, if there exists $U \subseteq \mathbb{C}^N$ such that $U \cap X = \{0\}$, then $\dim(X) \leq N - \dim(U)$.

Krull dimension of X 

Maximize δ 

Hilbert function of X 

Corollary: $\dim(X) \leq N - \frac{N+d-1}{d!} \delta \stackrel{\text{Maximize } \delta}{=} N - \frac{N+d-1}{d!} \left(1 - \frac{h_X(d)}{\binom{N+d-1}{d}}\right)$

Again: An upper bound on $\dim(X)$

Corollary:

For a conic variety $X \subseteq \mathbb{C}^N$,

$$\dim(X) \leq N - \frac{N+d-1}{d!} \left(1 - \frac{h_X(d)}{\binom{N+d-1}{d}} \right) \text{ for all } d \geq 1.$$

Other examples...

All in poly(N) time

- Schmidt rank $\leq r$ vectors:

$$X_r = \{v \in \mathbb{C}^n \otimes \mathbb{C}^n : \text{rank}(v) \leq r\}$$

$$\dim(U) = \Omega_r(n^2)$$

- Product tensors: $X_1 = \{v_1 \otimes \cdots \otimes v_m : v_1, \dots, v_m \in \mathbb{C}^n\}$

$$\dim(U) \sim \frac{1}{4} n^m$$

- Biseparable tensors:

$$X_B = \{T \in (\mathbb{C}^n)^{\otimes m} : \text{Some flattening of } T \text{ has rank } 1\}$$

$$\dim(U) \sim \frac{1}{4} n^m$$

- Slice rank 1 tensors

$$X_S = \{T \in (\mathbb{C}^n)^{\otimes m} : \text{Some 1 v.s. all flattening of } T \text{ has rank } 1\}$$

$$\dim(U) \sim \frac{1}{4} n^m$$

- Matrix product states:

$$\dim(U) \sim \frac{1}{4} n^m$$

The Algorithm (Nullstellensatz Certificate)

Part 1: Algorithm to certify $U \cap X = \{0\}$

Input:

1. Polynomials $f_1, \dots, f_p \in \mathbb{C}[x_1, \dots, x_N]$ that cut out X .
2. A basis $\{u_1, \dots, u_R\}$ for U .

Output: Proof that $U \cap X = \{0\}$

The symmetric subspace

Let $S^d(V) \subseteq V^{\otimes d}$ be the **symmetric subspace**

$$S^d(V) = \left\{ T = \left(T_{i_1, \dots, i_d} \right)_{i_j \in [N]} \in V^{\otimes d} : T = \left(T_{i_{\sigma(1)}, \dots, i_{\sigma(d)}} \right)_{i_j \in [N]} \text{ for all } \sigma \in \mathfrak{S}_d \right\}$$

$P_{d,V}^V: V^{\otimes d} \rightarrow V^{\otimes d}$ orthogonal projection onto $S^d(V)$

A characterization of conic varieties

Fact/Definition: For a subset $X \subseteq V$, the following are equivalent:

1. X is a conic variety
2. There exists $d \in \mathbb{N}$ and an orthogonal projection $\Psi_X^d: V^{\otimes d} \rightarrow V^{\otimes d}$ such that:
 - i. Ψ_X^d is **symmetric**: $\text{Im}(\Psi_X^d) \subseteq S^d(V)$
 - ii. $X = \{v \in V: v^{\otimes d} \in \text{Im}(\Psi_X^d)\}$

Why? If X is cut out by $f_1, \dots, f_p \in S^d(V^*)$, let $\Psi_X^d = \text{Proj} \left(\bigcap_{i=1}^p \text{Ker}(f_i) \right)$

$$v \in X \iff f_1(v^{\otimes d}) = \dots = f_p(v^{\otimes d}) = 0 \iff v^{\otimes d} \in \text{Im}(\Psi_X^d)$$

Question: Given a conic variety $X = \{v \in V: v^{\otimes d} \in \text{Im}(\Psi_X^d)\} \subseteq V$ and a basis $\{u_1, \dots, u_R\}$ for a subspace $U \subseteq \mathbb{C}^N$, is $U \cap X = \{0\}$?

$$S^d(U) = U^{\otimes d} \cap S^d(V) \\ = \text{span}\{P_{d,V}^V(u_{i_1} \otimes \dots \otimes u_{i_d}): 1 \leq i_1 \leq \dots \leq i_d \leq R\}$$

Algorithm:

1. If $\text{Im}(\Psi_X^d) \cap S^d(U) = \{0\}$, output $U \cap X = \{0\}$
2. Otherwise, output **I DON'T KNOW**

Correctness: If $\text{Im}(\Psi_X^d) \cap S^d(U) = \{0\}$, then $U \cap X = \{0\}$.

Proof: If $u \in U \cap X$, then $u^{\otimes d} \in \text{Im}(\Psi_X^d) \cap S^d(U)$. 

Theorem [JLV]: If $X \subseteq \mathbb{C}^N$ is cut out by $p = \delta \binom{N+d-1}{d}$ linearly independent homogeneous degree- d polynomials, then for a **generic** linear subspace $U \subseteq \mathbb{C}^N$ of dimension

$$\dim(U) \leq \frac{N + d - 1}{d!} \delta, \quad (1)$$

it holds that $\text{Im}(\Psi_X^d) \cap S^d(U) = \{0\}$.

Proof idea: Given a subspace $W := \text{Im}(\Psi_X^d) \subseteq S^d(\mathbb{C}^N)$, show that a (generic) subspace of the form $S^d(U)$, for $\dim(U)$ not too large, satisfies $W \cap S^d(U) = \{0\}$.

Proof idea: Given a subspace $W \subseteq S^d(\mathbb{C}^N)$, show that a (generic) subspace of the form $S^d(U)$, for $\dim(U)$ not too large, satisfies $W \cap S^d(U) = \{0\}$.

One might hope that you could take $R := \dim(U)$ maximal for which

$$\dim(W) + \binom{N + R - 1}{R} \leq \binom{N + d - 1}{d}$$

\uparrow \uparrow

$\dim(S^d(U))$ $\dim(S^d(\mathbb{C}^N))$

Proof idea: Given a subspace $W \subseteq S^d(\mathbb{C}^N)$, show that a (generic) subspace of the form $S^d(U)$, for $\dim(U)$ not too large, satisfies $W \cap S^d(U) = \{0\}$.

One might hope that you could take $R := \dim(U)$ maximal for which

$$\dim(W) + \binom{N + R - 1}{R} \leq \binom{N + d - 1}{d}$$

3 3 6

Not true! Take $N = 3, d = 2,$ $W = S^2(\mathbb{C}^2) \subseteq S^2(\mathbb{C}^3).$

Then for any $U \subseteq \mathbb{C}^3$ of dimension $\dim(U) = 2$, it holds that $S^2(\mathbb{C}^2) \cap S^2(U) \supseteq S^2(\mathbb{C}^2 \cap U) \neq \{0\}$

Question: Given a conic variety $X = \{v \in V : v^{\otimes d} \in \text{Im}(\Psi_X^d)\} \subseteq V$ and a basis $\{u_1, \dots, u_R\}$ for a subspace $U \subseteq \mathbb{C}^N$, is $U \cap X = \{0\}$?

Complete hierarchy:

1. For $c \geq d$, let $\Psi_X^c = (\Psi_X^d \otimes I_V^{\otimes c-d}) : V^{\otimes c} \rightarrow V^{\otimes c}$
2. If $\text{Im}(\Psi_X^c) \cap S^c(U) = \{0\}$ for some $c \leq (d+1)^N$, output **YES**
3. Otherwise, output **NO**

Correctness:

$\text{Im}(\Psi_X^c) \cap S^c(U) = \{0\}$ for some $c \leq (d+1)^N \iff U \cap X = \{0\}$

Proof: \Rightarrow : For any $u \in U \cap X$, it holds that $u^{\otimes c} \in \text{Im}(\Psi_X^c) \cap S^c(U)$.

\Leftarrow : Hilbert's Nullstellensatz + degree bounds

Outline

Given a conic variety $X \subseteq \mathbb{C}^N$ and a linear subspace $U \subseteq \mathbb{C}^N$, describe $U \cap X$.

Algorithms to describe $U \cap X$

1. Algorithm to certify $U \cap X = \{0\}$.
- ➔ Algorithm to determine $\text{dist}(U, X)$.
3. Algorithm to recover elements of $U \cap X$.

Part 2: Algorithm to determine $\text{dist}(U, X)$

Input:

1. Polynomials $f_1, \dots, f_p \in \mathbb{C}[x_1, \dots, x_N]$ that cut out X .
2. A basis $\{u_1, \dots, u_R\}$ for U .

Output: Lower bound on $\text{dist}(U, X)$

We have a complete hierarchy of *lower bounds* on $\text{dist}(U, X)$

Making the algorithm robust

Observation:

$$\text{Im}(\Psi_X^c) \cap S^c(U) = \{0\} \iff \lambda_{\max}(P_{d,V}^V \Psi_X^c(P_U \otimes I_V^{\otimes c-1})) < 1$$

Proof:

$$\lambda_{\max}(P_{d,V}^V \Psi_X^c(P_U \otimes I_V^{\otimes c-1})) < 1$$

$$\iff S^d(V) \cap \text{Im}(\Psi_X^c) \cap (U \otimes V^{\otimes c-1}) = \{0\}$$

$$\iff \text{Im}(\Psi_X^c) \cap S^c(U) = \{0\}$$

Making the algorithm robust

Observation:

$$\text{Im}(\Psi_X^c) \cap S^c(U) = \{0\} \iff \nu_c := \lambda_{\max}(P_{d,V}^V \Psi_X^c (P_U \otimes I_V^{\otimes c-1}) \Psi_X^c P_{d,V}^V) < 1$$

Proof:

$$\nu_c < 1$$

$$\iff S^d(V) \cap \text{Im}(\Psi_X^c) \cap (U \otimes V^{\otimes c-1}) = \{0\}$$

$$\iff \text{Im}(\Psi_X^c) \cap S^c(U) = \{0\}$$

Question: Given a conic variety $X = \{v \in V: v^{\otimes d} \in \text{Im}(\Psi_X^d)\} \subseteq V$ and a basis $\{u_1, \dots, u_R\}$ for a subspace $U \subseteq \mathbb{C}^N$, is $U \cap X = \{0\}$?

$$v_c := \lambda_{\max}(P_{d,V}^V \Psi_X^c (P_U \otimes I_V^{\otimes c-1}) \Psi_X^c P_{d,V}^V)$$

Complete hierarchy:

1. If $v_c < 1$ for some $c \leq (d+1)^N$, output **YES**
2. Otherwise, output **NO**

Correctness:

$$v_c < 1 \iff \text{Im}(\Psi_X^c) \cap S^c(U) = \{0\}$$

Robust version

Question: Given a conic variety $X = \{v \in V: v^{\otimes d} \in \text{Im}(\Psi_X^d)\} \subseteq V$ and a basis $\{u_1, \dots, u_R\}$ for a subspace $U \subseteq \mathbb{F}^N$, what is $\text{dist}(U, X)$?

$$\text{dist}(U, X) = \frac{1}{4} \min_{\substack{x \in X \\ \|x\|=1}} \min_{\substack{u \in U \\ \|u\|=1}} \|xx^* - uu^*\|_1^2$$

Hausdorff distance 

$$= 1 - \max_{\substack{x \in X \\ \|x\|=1}} \max_{\substack{u \in U \\ \|u\|=1}} |\langle x, u \rangle|^2$$

$$= 1 - \max_{\substack{x \in X \\ \|x\|=1}} \langle x, P_U x \rangle$$

Question: Given a conic variety $X = \{v \in V: v^{\otimes d} \in \text{Im}(\Psi_X^d)\} \subseteq V$ and a basis $\{u_1, \dots, u_R\}$ for a subspace $U \subseteq \mathbb{C}^N$, what is $\text{dist}(U, X)$?

Theorem [JLV]: $v_c := \lambda_{\max}(P_{d,V}^V \Psi_X^c (P_U \otimes I_V^{\otimes c-1}) \Psi_X^c P_{d,V}^V)$

- $v_c < 1$ for some $c \leq (d+1)^N$ if and only if $U \cap X = \{0\}$
- $\text{dist}(U, X) \geq 1 - v_c$ for all c (inner approximation)
- $\text{dist}(U, X) = 1 - \lim_{c \rightarrow \infty} v_c$

Computing upper bounds on $\text{dist}(U, X)$ is easy...
 $\text{dist}(U, X) \leq \text{dist}(u, x)$ for any $x \in X, u \in U$

We have a complete hierarchy of *lower bounds* on $\text{dist}(U, X)$

Theorem [JLV]:

$$v_c := \lambda_{\max}(P_{d,V}^V \Psi_X^c (P_U \otimes I_V^{\otimes c-1}) \Psi_X^c P_{d,V}^V)$$

• $v_c = 1$ for all $c \leq (d+1)^N \iff \text{dist}(U, X) = 0$ ✓

• $v_d \geq v_{d+1} \geq v_{d+2} \geq \dots$

• $1 - \text{dist}(U, X) = \lim_{c \rightarrow \infty} v_c$

In particular, $1 - \text{dist}(U, X) \leq v_c$ for all c (inner approximation)

Proof:

$$\text{Im}(P_{d,V}^V \Psi_X^c) \supseteq \text{span}\{v^{\otimes c} : v \in X\}, \quad \text{so for all } v \in X,$$

$$v_c \geq \langle v^{\otimes c}, P_{d,V}^V \Psi_X^c (P_U \otimes I_V^{\otimes c-1}) \Psi_X^c P_{d,V}^V v^{\otimes c} \rangle$$

$$= \langle v^{\otimes c}, (P_U \otimes I_V^{\otimes c-1}) v^{\otimes c} \rangle$$

$$= \langle v, P_U v \rangle$$

$$\dots \text{ So } v_c \geq \max_{v \in X} \langle v, P_U v \rangle = 1 - \text{dist}(U, X)$$

Outline

Given a conic variety $X \subseteq \mathbb{C}^N$ and a linear subspace $U \subseteq \mathbb{C}^N$, describe $U \cap X$.

Algorithms to describe $U \cap X$

1. Algorithm to determine whether $U \cap X = \{0\}$.
2. Algorithm to determine $\text{dist}(U, X)$.

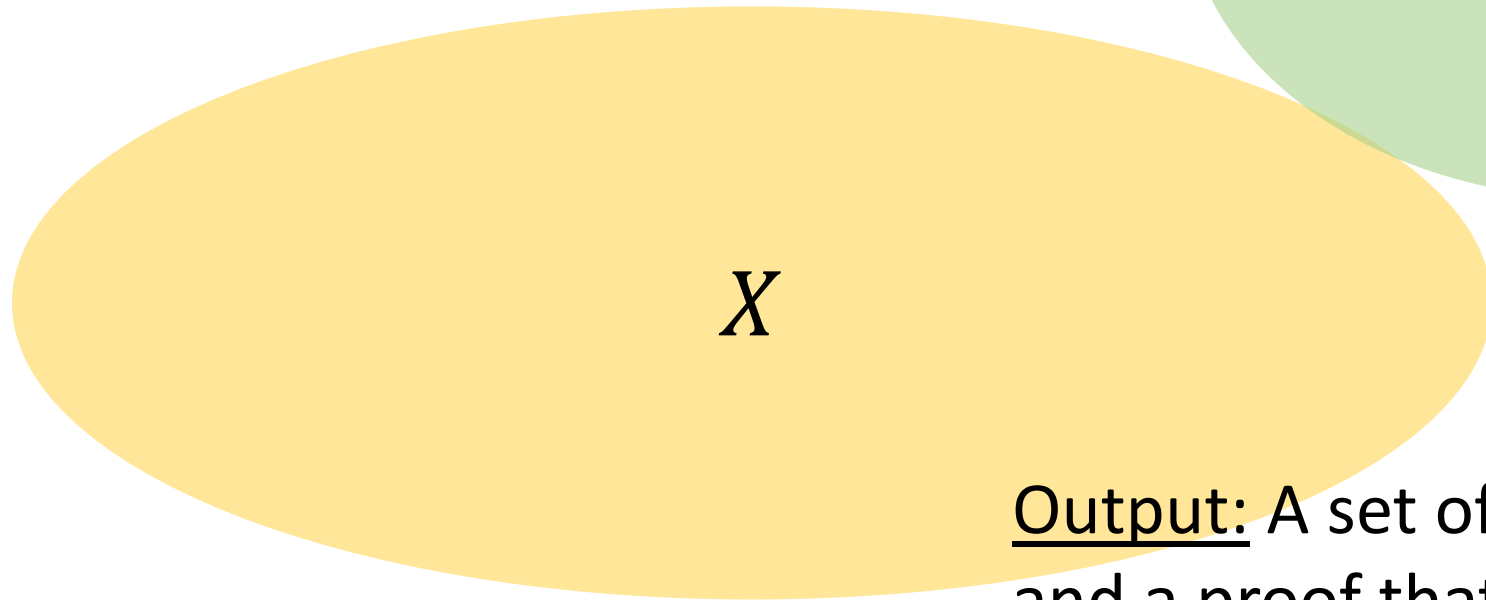

➔ Algorithm to recover elements of $U \cap X$.

Part 3: Algorithm to recover elements of $U \cap X$

Input:

1. Polynomials $f_1, \dots, f_p \in \mathbb{C}[x_1, \dots, x_N]$ that cut out X .
2. A basis $\{u_1, \dots, u_R\}$ for U .

Output: A set of points $\{v_1, \dots, v_s\} \in U \cap X$, and a proof that these are the only elements (up to scalar multiples).

The Algorithm (Inspired by Nullstellensatz Certificate)

Recall the algorithm to determine if $U \cap X = \{0\}$...

$$S^d(U) = U^{\otimes d} \cap S^d(V)$$

Algorithm:

$$= \text{span}\{P_{d,V}^V(u_{i_1} \otimes \cdots \otimes u_{i_d}) : 1 \leq i_1 \leq \cdots \leq i_d \leq R\}$$

1. If $\text{Im}(\Psi_X^d) \cap S^d(U) = \{0\}$, output $U \cap X = \{0\}$

2. Otherwise, output **I DON'T KNOW**

Idea: To **find** vectors in $U \cap X$, **look at** the vectors in $\text{Im}(\Psi_X^d) \cap S^d(U)$.

If $v = \sum_{i=1}^R \alpha_i u_i \in U \cap X$, then

$$v^{\otimes d} = \sum_{i_1, \dots, i_d} \alpha_{i_1} \cdots \alpha_{i_d} (u_{i_1} \otimes \cdots \otimes u_{i_d}) \in \text{Im}(\Psi_X^d) \cap S^d(U) \quad (1)$$

The tensor of coefficients $\alpha^{\otimes d} \in (\mathbb{C}^R)^{\otimes d}$ is a (symmetric) product tensor!

Take-home: vectors in $U \cap X \iff$ sym. prod. tensors $\alpha_{i_1 \dots i_d}$ that solve (1)

Algorithm to find elements of $U \cap X$

1. **Compute** a basis $\{A_1, \dots, A_{R'}\} \subseteq (\mathbb{C}^R)^{\otimes d}$ for the set of tensors $\alpha \in S^d(\mathbb{C}^R)$ s.t.

$$\sum_{i_1, \dots, i_d} \alpha_{i_1, \dots, i_d} (u_{i_1} \otimes \dots \otimes u_{i_d}) \in \text{Im}(\Psi_X^d) \cap S^d(U)$$

2. **Find** the symmetric product tensors in $\text{span}\{A_1, \dots, A_{R'}\} \subseteq (\mathbb{C}^R)^{\otimes d}$

Run **Jennrich's algorithm**

Jennrich's Algorithm

Input: A basis $\{A_1, \dots, A_R\}$ for a subspace $Z \subseteq \mathbb{C}^R \otimes \mathbb{C}^S$ of dimension $R \leq S$

If Z has a basis of the form $\{x_1 \otimes y_1, \dots, x_R \otimes y_R\}$,

where $\{x_1, \dots, x_R\}$ and $\{y_1, \dots, y_R\}$ are linearly independent

Then $x_1 \otimes y_1, \dots, x_R \otimes y_R$ are the **only** elements of $U \cap X_1$, and Jennrich's algorithm **outputs these elements**. Otherwise, it outputs **FAIL**.

Note: This version of Jennrich can only handle $\dim(Z) \leq R$, whereas our "lifted Jennrich" can do $\dim(Z) \leq \Omega(R^2)$

Theorem [JLV]: Case of $X_1 = \{v \in \mathbb{C}^n \otimes \mathbb{C}^n : \text{rank}(v) \leq 1\}$

For a **generic** linear subspace $U \subseteq \mathbb{C}^n \otimes \mathbb{C}^n$ of dimension

$$R \leq \frac{1}{4}(n-1)^2$$

Constant multiple of
maximum possible $(n-1)^2$

it holds that $U \cap X_1 = \{0\}$, and our algorithm **certifies** this in time $n^{O(1)}$.

Moreover, for a generic subspace $U \subseteq \mathbb{C}^n \otimes \mathbb{C}^n$ of this dimension with a basis of **generic** elements of X_1 , our algorithm **recovers** these elements in time $n^{O(1)}$, and **certifies** that these are the **only** elements of $U \cap X_1$.

Analytic def: "If you pick $v_1, \dots, v_R \in X_1$ randomly..."

Algebraic def: There is a Zariski open dense subset $A \subseteq X_1^{\times R}$ such that...

Corollary: A **generic** tensor $T \in \mathbb{C}^n \otimes \mathbb{C}^n \otimes \mathbb{C}^m$ with

$$\text{rank}(T) =: R \leq \min\left\{\frac{1}{4}(n-1)^2, m\right\}$$

has a unique rank decomposition, which is recovered by applying our algorithm to $T(\mathbb{C}^m)$.

Analytic def: $T = \sum_{i=1}^R x_i \otimes y_i \otimes z_i$, where each $x_i \otimes y_i \otimes z_i$ is chosen randomly.

Algebraic def: There is a Zariski open dense subset $A \subseteq \{\text{rank} \leq R \text{ tensors}\}$

Theorem [JLV]: If $X \subseteq \mathbb{C}^N$ is **irreducible**, cut out by $p = \delta \binom{N+d-1}{d}$ linearly independent homogeneous degree- d polynomials, and **has no equations in degree $d - 1$** , then for a linear subspace $U \subseteq \mathbb{C}^N$ of dimension

$$R \leq \frac{N + d - 1}{d!} \delta,$$

with a basis of **generic** elements of X , our algorithm recovers these elements in time $N^{O(d)}$.

Algebraic def: There is a Zariski open dense subset $A \subseteq X^{\times R}$ s.t...

(X, \mathbb{C}^m) -decompositions (aka simult. X -decomp)

For $T \in V \otimes \mathbb{C}^m$, an expression

$$T = \sum_{i=1}^R v_i \otimes z_i \in V \otimes \mathbb{C}^m$$

where $v_1, \dots, v_R \in X$

we call an (X, \mathbb{C}^m) -decomposition of T .

$\text{rank}_X(T) := \min\{R: \text{there exists an } (X, \mathbb{C}^m)\text{-decomposition of } T \text{ of length } R\}$

Corollary: A generic tensor $T \in V \otimes \mathbb{C}^m$ with

$$\text{rank}_X(T) \leq \min\left\{\frac{N + d - 1}{d!} \delta, m\right\}$$

has a unique (X, \mathbb{C}^m) -decomposition, which is recovered by applying our algorithm to $T(\mathbb{C}^m)$.

Other examples...

- Schmidt rank $\leq r$ vectors:

$$X_r = \{v \in \mathbb{C}^n \otimes \mathbb{C}^n : \text{rank}(v) \leq r\}$$

Recover (X_r, \mathbb{C}^m) – decompositions of rank $\Omega_r(n^2)$

- Product tensors: $X_1 = \{v_1 \otimes \cdots \otimes v_{k/2} : v_1, \dots, v_{k/2} \in \mathbb{C}^n\}$

Recover tensor decompositions in $(\mathbb{C}^n)^{\otimes k}$
of rank $\sim n^{k/2}$

- Biseparable tensors:

$$X_B = \{T \in (\mathbb{C}^n)^{\otimes m} : \text{Some flattening of } T \text{ has rank } 1\}$$

- Slice rank 1 tensors

$$X_S = \{T \in (\mathbb{C}^n)^{\otimes m} : \text{Some 1 v.s. all flattening of } T \text{ has rank } 1\}$$

Not irreducible!

Other examples...

- Schmidt rank $\leq r$ vectors:

$$X_r = \{v \in \mathbb{C}^n \otimes \mathbb{C}^n : \text{rank}(v) \leq r\}$$

Recover (X_r, \mathbb{C}^m) – decompositions of rank $\Omega_r(n^2)$

- Product tensors: $X_1 = \{v_1 \otimes \cdots \otimes v_k : v_1, \dots, v_m \in \mathbb{C}^n\}$

Recover tensor decompositions in $(\mathbb{C}^n)^{\otimes k}$
of rank $\sim n^{k/2}$

Conclusion

- Take home message 1: For an arbitrary variety $X \subseteq \mathbb{C}^N$, we can **efficiently certify** $U \cap X = \{0\}$ for a generic subspace $U \subseteq \mathbb{C}^N$ of dimension not too large. (**First level of Nullstellensatz certificate**)
- Take home message 2: This inspires a hierarchy of eigenvalue computations to compute the Hausdorff **distance** between U and X . (**Robust version of Nullstellensatz certificate**)
- Take home message 3: Also inspires an algorithm for **finding** elements of $U \cap X$, with similar genericity guarantees.

Open problems:

- Non-generic inputs U ?
- Remove irreducibility/degree assumptions on the algorithm to find elements of $U \cap X$?

Computing linear sections of varieties: quantum entanglement, tensor decompositions and beyond
